

Training Day 2 Daily Dairy

june-6

Task accomplished

Today's focus was on creating Django applications and understanding how views work in Django. We explored how to structure applications, link them to the project, and render views effectively. Below are the tasks completed:

1. Creating a Django App:

- Learned the importance of Django apps and their role in modularizing the project.
- Created the first app named **blog** using the command **python manage.py startapp blog**.
- Explored the directory structure of the app, including files like **views.py**, **models.py**, and **admin.py**.
- Registered the app in the project by adding it to the **INSTALLED_APPS** list in **settings.py**.

2. Creating Views:

- Understood the purpose of views in Django, which control what data is sent to the client and how it is presented.
- Wrote basic view functions in `views.py` that return `HttpResponse` with plain text.
- Linked views to specific URLs by configuring `urls.py` in both the project and app level.
